

What is the specific internal energy of compressed liquid water at 3.0 MPa and 60 °C?

**SOLUTION:**

For this case, there is no table entry for either 3.0 MPa or 60 °C so we must linearly interpolate with respect to both temperature and pressure (called bilinear interpolation),

$$u_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}} - u_{2.5 \text{ MPa}, 40 \text{ }^\circ\text{C}} = \left( \frac{u_{2.5 \text{ MPa}, 80 \text{ }^\circ\text{C}} - u_{2.5 \text{ MPa}, 40 \text{ }^\circ\text{C}}}{T_{2.5 \text{ MPa}, 80 \text{ }^\circ\text{C}} - T_{2.5 \text{ MPa}, 40 \text{ }^\circ\text{C}}} \right) (T_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}} - T_{2.5 \text{ MPa}, 40 \text{ }^\circ\text{C}}), \tag{1}$$

$$u_{5.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} - u_{5.0 \text{ MPa}, 40 \text{ }^\circ\text{C}} = \left( \frac{u_{5.0 \text{ MPa}, 80 \text{ }^\circ\text{C}} - u_{5.0 \text{ MPa}, 40 \text{ }^\circ\text{C}}}{T_{5.0 \text{ MPa}, 80 \text{ }^\circ\text{C}} - T_{5.0 \text{ MPa}, 40 \text{ }^\circ\text{C}}} \right) (T_{5.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} - T_{5.0 \text{ MPa}, 40 \text{ }^\circ\text{C}}),$$

$$u_{3.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} - u_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}} = \left( \frac{u_{5.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} - u_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}}}{p_{5.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} - p_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}}} \right) (p_{3.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} - p_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}}),$$

where,

- $u_{2.5 \text{ MPa}, 40 \text{ }^\circ\text{C}} = 167.25 \text{ kJ/kg}$
- $u_{2.5 \text{ MPa}, 80 \text{ }^\circ\text{C}} = 334.29 \text{ kJ/kg}$
- $u_{5.0 \text{ MPa}, 40 \text{ }^\circ\text{C}} = 166.95 \text{ kJ/kg}$
- $u_{5.0 \text{ MPa}, 80 \text{ }^\circ\text{C}} = 333.72 \text{ kJ/kg}$
- $T_{2.5 \text{ MPa}, 40 \text{ }^\circ\text{C}} = T_{5.0 \text{ MPa}, 40 \text{ }^\circ\text{C}} = 40 \text{ }^\circ\text{C}$
- $T_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}} = T_{5.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} = 60 \text{ }^\circ\text{C}$
- $T_{2.5 \text{ MPa}, 80 \text{ }^\circ\text{C}} = T_{5.0 \text{ MPa}, 80 \text{ }^\circ\text{C}} = 80 \text{ }^\circ\text{C}$
- $p_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}} = 2.5 \text{ MPa}$
- $p_{3.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} = 3.0 \text{ MPa}$
- $p_{5.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} = 5.0 \text{ MPa}$

$$\Rightarrow u_{2.5 \text{ MPa}, 60 \text{ }^\circ\text{C}} = 250.77 \text{ kJ/kg}, u_{5.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} = 250.34 \text{ kJ/kg} \Rightarrow u_{3.0 \text{ MPa}, 60 \text{ }^\circ\text{C}} = 250.68 \text{ kJ/kg}$$

Note that the same result would be achieved if we interpolated first with respect to pressure and then with respect to temperature.
