Sun Hydraulics Corporation in Sarasota, FL has engineering internship opportunities available for spring / summer 2012. Spring opportunities are being filled on going. We generally try to fill the summer openings by spring break. Positions available are in valve and manifold product design groups as well as manufacturing engineering group. Hands on, self-motivated students from mechanical, electrical and particularly manufacturing engineering programs are encouraged to apply. Previous internship experience in a manufacturing environment is useful, but not necessary. Our preference is for students from the south east United States. Typically freshman and sophomore engineering students will gain valuable experience by working in manufacturing areas. Junior, senior and post graduate students hired as interns will be assigned to a specific engineering area.

After an initial “shop tour” in which the junior / senior / post graduate student will work briefly in each of the manufacturing departments, an experienced engineer will act as a mentor for the student to complete a project. Past projects have included extensive laboratory experimentation, modeling and simulation, and the design and build of a small machine for use in the manufacturing process.
