Objectives - Fri 2/7/2020

- Call stack
- Pass-by-address
- swap(...) function

Stack

addr	type*	name*	value	part	fn
200	int	argc	1	orac	
204	char**	argv	→ {"./foo"}	args	Щ
212	void*			ret addr	main(
220	int	а	5	locals	:
224	int	b	7		
228	int*	a_n1	220	args	S
228 236	int* int*	a_n1 a_n2	220 224	args	swa
-				args ret addr	swap(
236	int*				swap()
236 244 252	int* void*	a_n2	224	ret addr	swap()
236 244	int* void* int	a_n2 temp	5	ret addr locals	swap()
236 244 252	int* void* int This memory fo	a_n2	5 ws the state of the	ret addr locals	swap()

Heap

псар						
addr	value	4				
400						

This memory form diagram shows the state of the stack while executing swap_right.c, just before line 7 (i.e., after int temp = $*a_n1$; and before $*a_n1 = *a_n2$;).

The heap segment and data segment are not used.

The swap_right.c example was used in Prof. Quinn's lecture on 2/7/2020.

Data segment

addr	type*	value
600		

Type and name are not actually stored in memory or executable. Addresses shown are fictional. Assume sizeof(int) == 4, sizeof(char) == 1, sizeof(void*) == 8.
