## ECE661: Homework 1

## Fall 2016

Turn in typed solutions via Blackboard. Additional instructions can be found at [I]

1. What are all the points in the representational space $\mathcal{R}^{3}$ that are the homogeneous coordinates of the origin in the physical space $\mathcal{R}^{2}$ ?
2. Are all points at infinity in the physical plane $\mathcal{R}^{2}$ the same? Justify your answer.
3. Argue that the matrix rank of a degenerate conic can never exceed 2.
4. Derive in just 3 steps the intersection of two lines $l_{1}$ and $l_{2}$ with $l_{1}$ passing through the points $(0,0)$ and $(2,3)$, and with $l_{2}$ passing through the points $(-3,3)$ and $(-1,2)$. How many steps would take you if the second line passed through $(-4,-5)$ and $(4,5)$ ?
5. Consider that there are two lines. The first line is passing through points $(0,0)$ and $(2,-2)$. The second line is passing through points $(-3,0)$ and $(0,-3)$. Find the intersection between these two lines. Comment on your answer.
6. As you know, when a point $x$ is on a conic, the tanget to the conic at that point is given by $l=C x$. That raises the question of what $C x$ corresponds to when $x$ is, say, outside the conic. As you'll see later in class, when $x$ is outside the conic, $C x$ is the line that joins the two points of contact if you draw tangents to $C$ from the point $x$. This line is referred to as the polar line. Now consider for our conic a circle of radius 1 that is centered at the coordinates $(-6,-6)$ and let $x$ be the origin of the $\mathcal{R}^{2}$ physical plane. Where does the polar line intersect the $x$ and $y$ axes in this case?
