I. Logic of the problems

The report will use three methods to generate the image without projective and affine distortion. The concept of the methods is shown in Figure 0. We are going to apply two different 2-step methods and remove the affine distortion and projective distortion separately. For the 2-step method, one is use the at least 4 corresponding points in both image and world to find the Hp (homography for remove the projective distortion). The other is to use 2 parallel line pairs to find the vanishing line for determining the Hp and remove the projective distortion. After removing the projective distortion, the second step is to find the Ha for removing the affine distortion. In this step, we need at least 2 orthogonal line pairs to identify the Ha. The other method is single step method to remove both projective and affine distortion by determining the dual degenerate conic to identify find the homography Hp+a. In order to identify the dual degenerate conic, we need at least 5 orthogonal line pairs to resolve 5 parameters.

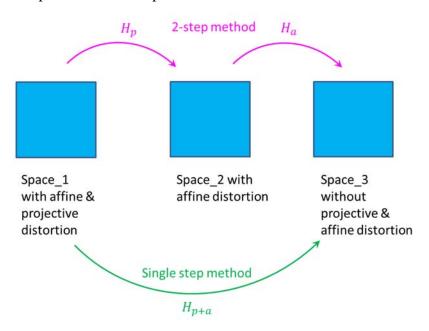

Figure 0. Concept of 2 step and single step homography

II. Steps and Equations

A.1 2-steps method – Remove projective distortion

(1) Use point-point to derive the homography (Hp) between image and world

1. The homography H between image and world without projective distortion can be written as following equations. Since H is a ratio, so we can put the h₃₃ as 1. Then, we only have 8 parameters to be solved and we can use at least 4 corresponding points to find the parameters.

$$x' = H_p x \qquad (1)$$

$$H_p = \begin{bmatrix} h_{11} & h_{12} & h_{13} \\ h_{21} & h_{22} & h_{23} \\ h_{31} & h_{32} & h_{33} \end{bmatrix} = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & 1 \end{bmatrix} \qquad (2)$$

$$\begin{pmatrix} x'_1 \\ x'_2 \\ x'_3 \end{pmatrix} = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & 1 \end{bmatrix} \begin{pmatrix} x \\ y \\ 1 \end{pmatrix} \qquad (3)$$

The world coordinate can be written as physical coordinate in the following equations. Then, we can use at least 4 corresponding points to derive the parameters $(a_1 \ a_2 \ a_3 \ b_1 \ b_2 \ b_3 \ c_1 \ c_2)$ through least squares method and determine the homography Hp.

$$X = \frac{x_1}{x_3} = \frac{a_1 x + b_1 y + c_1}{a_3 x + b_3 y + 1} \tag{4}$$

$$Y = \frac{x_{2}}{x_{3}} = \frac{a_{2}x + b_{2}y + c_{2}}{a_{3}x + b_{3}y + 1}$$
 (5)

In my code, my Hp is image to world. After, deriving the Hp, we multiply the Hp to bounding box of image for finding the corresponding area in world. Since the corresponding area would be too large or too small, therefore, I use a scale to control the size and find the min coordinate fit to the new image (0,0) for generating the new image without projective. Then the area in the world are go through to find the color in the image with inv(Hp).

(2) Use 2 parallel line pairs to derive the homography (Hp) between image and world.

The homography, Hp, for removing the projective distortion can be estimated from the parameters of the vanishing line. So we only need to derive the vanishing line to establish the Hp. First, two pair of line that are physically parallel are taken. A line parameter can be derive from two points (p &q) (Equ. 6). Then, a vanishing points can be derived from 2 physically parallel lines (1 &m) (Equ. 7). Two vanishing points will be used to find a vanishing line (Equ 8). Hp can be represented by the vanishing line in Equ 9.

$$l = p \times q \quad (6)$$

$$p_{van} = l \times m \quad (7)$$

$$l_{van} = p_{van} \times q_{van} \quad (8)$$

$$H_p = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ l_{van1} & l_{van2} & l_{van3} \end{bmatrix}$$
 (9)

A.2 2-steps method – Remove affine distortion

We are going to use two physically orthogonal line pair to remove the affine distortion in this step. The angle between two lines (1 & m) in world can be represent as Eq. (10) which can be represented by dual degenerate conic in Eq. (11). When I and m are orthogonal and the Eq. 11 can be written as Eq 12 by transform dual conics as $C^{*'} = HC^*H^T$. Let $S = AA^T$ and Eq 12 can be written as Eq 13.

$$\cos\theta = \frac{l_{1}m_{1} + l_{2}m_{2}}{\sqrt{(l_{1}^{2} + l_{2}^{2})(m_{1}^{2} + m_{2}^{2})}} (10)$$

$$\cos\theta = \frac{l^{T}C_{\infty}^{*}m}{\sqrt{(l^{T}C_{\infty}^{*}m)(m^{T}C_{\infty}^{*}l)}} (11)$$

$$l'^{T}HC_{\infty}^{*}H^{T}m' = l'^{T}\begin{bmatrix} A & \vec{t} \\ \vec{0} & 1 \end{bmatrix}\begin{bmatrix} I & \vec{0} \\ \vec{0} & 1 \end{bmatrix}\begin{bmatrix} A^{T} & \vec{0} \\ \vec{t}^{T} & 1 \end{bmatrix}m' = l'^{T}\begin{bmatrix} AA^{T} & \vec{0} \\ 0 & 0 \end{bmatrix}m' = 0 (12)$$

$$, \text{where } H_{a} = \begin{bmatrix} A & \vec{0} \\ \vec{0} & 1 \end{bmatrix}$$

$$(l'_{1} l'_{2})\begin{bmatrix} s_{11} & s_{12} \\ s_{21} & s_{22} \end{bmatrix}\begin{pmatrix} m'_{1} \\ m'_{2} \end{pmatrix} = 0 (13)$$

For the S, only ratio is matter so we can take $s_{22} = 1$ and only 3 unknown ($s_{11} \& s_{12} \& s_{21}$). Eq 13 can be written as Eq 14. Moreover, S is symmetric so $s_{12} = s_{21}$. Therefore, we only need to derive $s_{11} \& s_{12}$ with Eq 15.

$$s_{11}l'_1m'_1 + s_{12}(l'_1m'_2 + l'_2m'_1) + s_{22}l'_2m'_2 = 0 \quad (14)$$
$$[l'_1m'_1 \quad l'_1m'_2 + l'_2m'_1] \begin{bmatrix} s_{11} \\ s_{12} \end{bmatrix} = -l'_2m'_2 \quad (15)$$

Since $A = VDV^T$, $S = AA^T = VD^2V^T$, we can use the SVD decomposition to solve the V & D and derive A. After determining A, Ha can be obtained.

In my code, the Ha is from world without projective and affine (pure world) to world with affine. Therefore, we need to multiply inv(Ha) with Hp to find the homography (H) from image with projective and affine distortion to pure world. The bounding box of image is multiply H to identify the area in pure world. Since the corresponding area would be too large or too small, therefore, I use a scale to control the size and find the min coordinate fit to the new image (0,0) for generating the new image without projective. Then the area in the world are go through to find the color in the image with inv(H).

B Single Step Method – Remove both projective and affine distortion

We use dual conic to derive the parameters of homography (Hp+a), Eq. 16, that can remove both affine and projective distortion. With the fact that $C^{*'} = HC^*H^T$, the dual conic can be represented as Eq. 16. Take two physically orthogonal lines which $\cos \theta = 0$, in the image, the two lines can be represented in Eq 17. 6 parameters (a, b, c, d, e, f) are going to be derived. However, since only ratio is matter, we set f = 1 which is written in Eq 18. With at least 5 pairs physically orthogonal line, we can solve the parameters (a, b, c, d, e) to derive the conic.

$$\mathbf{H}_{p+a} = \begin{bmatrix} A & 0 \\ v^T & 1 \end{bmatrix} \quad (16)$$

$$C_{\infty}^{*'} = \begin{bmatrix} AA^{T} & Av \\ v^{T}A^{T} & v^{T}v \end{bmatrix} = HC_{\infty}^{*}H^{T} = \begin{bmatrix} a & b/2 & d/2 \\ b/2 & c & e/2 \\ d/2 & e/2 & f \end{bmatrix} (17)$$

$$l'^{T}HC_{\infty}^{*}H^{T}m' = l'^{T} \begin{bmatrix} a & b/2 & d/2 \\ b/2 & c & e/2 \\ d/2 & e/2 & f \end{bmatrix} m' (18)$$

$$\left(l'_{1}m'_{1}, \frac{l'_{1}m'_{2} + l'_{2}m'_{1}}{2}, l'_{2}m'_{2}, \frac{l'_{1}m'_{3} + l'_{3}m'_{1}}{2}, \frac{l'_{2}m'_{3} + l'_{3}m'_{2}}{2} \right) \begin{pmatrix} a \\ b \\ c \\ d \end{pmatrix} = -l'_{3}m'_{3} (19)$$

After deriving the conic, the AA^T can be solved by SVD and to derive A and the v can be derived from v^TA^T . After getting A & v, the homography (Hp+a) can be derived.

Since we directly derive the Hp+a, we only need to multiply that with the bounding box of image to identify the area in pure world and apply a scale to control the size of output image. Finally, from the image in pure world to find the corresponding area in original image to fill the color.

V. Observation

- (a) Comparing two different methods (2-steps and single step), the single step method would be more sensitive to the measured coordinates. Since I have implemented the 2-steps (point-point & vanishing line) and single step method, I found the point-point could be the most robust way to remove the projective distortion which are not much sensitive to the picking points.
- (b) For removing the projective distortion, when the lines pair are not parallel in the physical space the result may not be ideal. It means this way is sensitive to the given dataset.
- (c) Since both 2-step methods need to use orthogonal lines for solving the affine distortion, when the picking lines are not orthogonal in the physical space, the results would be also not ideal.

Sometimes, even a pixel will affect the results, especially when the size of image is small but it covers large area in the physical world, a pixel could be huge different in the physical space.

- (d) For me, the single step method is the most sensitive one. Not only those lines should be really represented the orthogonal lines in physical space but also those line should be consistent. Since we are going to use at least five pair to solve the problem, if one pair of line is not good, it will totally affect the results.
- (e) All the methods can derive the image without projective and affine distortion. However, there may exist some scaling problem that are not solved (similarity transformation.) Moreover, when the measured points are not very ideal, the scale would shows on both x and y directions.
- (5) The wideangle imagery has other distortion. After removing affine and projective distortion we still can see the distortion there.
