

# Lectures on Electromagnetic Field Theory

WENG CHO CHEW

Spring 2021,<sup>1</sup> Purdue University

<sup>1</sup>Updated May 18, 2021

# Contents

<b>Preface</b>	<b>xi</b>
<b>Acknowledgements</b>	<b>xii</b>
<b>1 Introduction, Maxwell's Equations</b>	<b>1</b>
1.1 Importance of Electromagnetics . . . . .	1
1.1.1 A Brief History of Electromagnetics . . . . .	4
1.2 Maxwell's Equations in Integral Form . . . . .	6
1.3 Static Electromagnetics . . . . .	7
1.3.1 Coulomb's Law (Statics) . . . . .	7
1.3.2 Electric Field (Statics) . . . . .	8
1.3.3 Gauss's Law for Electric Flux (Statics) . . . . .	10
1.3.4 Derivation of Gauss's Law from Coulomb's Law (Statics) . . . . .	11
<b>2 Maxwell's Equations, Differential Operator Form</b>	<b>15</b>
2.1 Gauss's Divergence Theorem . . . . .	15
2.1.1 Some Details . . . . .	17
2.1.2 Gauss's Law in Differential Operator Form . . . . .	19
2.1.3 Physical Meaning of Divergence Operator . . . . .	19
2.2 Stokes's Theorem . . . . .	20
2.2.1 Faraday's Law in Differential Operator Form . . . . .	23
2.2.2 Physical Meaning of Curl Operator . . . . .	24
2.3 Maxwell's Equations in Differential Operator Form . . . . .	24
2.4 Historical Notes . . . . .	25
<b>3 Constitutive Relations, Wave Equation, and Static Green's Function</b>	<b>27</b>
3.1 Simple Constitutive Relations . . . . .	27
3.2 Emergence of Wave Phenomenon, Triumph of Maxwell's Equations . . . . .	28
3.3 Static Electromagnetics—Revisited . . . . .	32
3.3.1 Electrostatics . . . . .	32
3.3.2 Poisson's Equation . . . . .	33
3.3.3 Static Green's Function . . . . .	34
3.3.4 Laplace's Equation . . . . .	35

<b>4</b>	<b>Magnetostatics, Boundary Conditions, and Jump Conditions</b>	<b>39</b>
4.1	Magnetostatics . . . . .	39
4.1.1	More on Coulomb Gauge . . . . .	41
4.2	Boundary Conditions—1D Poisson’s Equation . . . . .	41
4.3	Boundary Conditions—Maxwell’s Equations . . . . .	43
4.3.1	Faraday’s Law . . . . .	44
4.3.2	Gauss’s Law for Electric Flux . . . . .	45
4.3.3	Ampere’s Law . . . . .	46
4.3.4	Gauss’s Law for Magnetic Flux . . . . .	48
<b>5</b>	<b>Biot-Savart law, Conductive Media Interface, Instantaneous Poynting’s Theorem</b>	<b>49</b>
5.1	Derivation of Biot-Savart Law . . . . .	50
5.2	Shielding by Conductive Media . . . . .	52
5.2.1	Boundary Conditions—Conductive Media Case . . . . .	52
5.2.2	Electric Field Inside a Conductor . . . . .	53
5.2.3	Magnetic Field Inside a Conductor . . . . .	54
5.3	Instantaneous Poynting’s Theorem . . . . .	56
<b>6</b>	<b>Time-Harmonic Fields, Complex Power</b>	<b>61</b>
6.1	Time-Harmonic Fields—Linear Systems . . . . .	62
6.2	Fourier Transform Technique . . . . .	64
6.3	Complex Power . . . . .	65
<b>7</b>	<b>More on Constitutive Relations, Uniform Plane Wave</b>	<b>69</b>
7.1	More on Constitutive Relations . . . . .	69
7.1.1	Isotropic Frequency Dispersive Media . . . . .	69
7.1.2	Anisotropic Media . . . . .	71
7.1.3	Bi-anisotropic Media . . . . .	72
7.1.4	Inhomogeneous Media . . . . .	72
7.1.5	Uniaxial and Biaxial Media . . . . .	73
7.1.6	Nonlinear Media . . . . .	73
7.2	Wave Phenomenon in the Frequency Domain . . . . .	74
7.3	Uniform Plane Waves in 3D . . . . .	75
<b>8</b>	<b>Lossy Media, Lorentz Force Law, Drude-Lorentz-Sommerfeld Model</b>	<b>79</b>
8.1	Plane Waves in Lossy Conductive Media . . . . .	79
8.1.1	Highly Conductive Case . . . . .	81
8.1.2	Lowly Conductive Case . . . . .	81
8.2	Lorentz Force Law . . . . .	82
8.3	Drude-Lorentz-Sommerfeld Model . . . . .	82
8.3.1	Cold Collisionless Plasma Medium . . . . .	83
8.3.2	Bound Electron Case . . . . .	85
8.3.3	Damping or Dissipation Case . . . . .	86
8.3.4	Broad Applicability of Drude-Lorentz-Sommerfeld Model . . . . .	87

8.3.5	Frequency Dispersive Media . . . . .	89
8.3.6	Plasmonic Nanoparticles . . . . .	90
<b>9</b>	<b>Waves in Gyrotropic Media, Polarization</b>	<b>93</b>
9.1	Gyrotropic Media and Faraday Rotation . . . . .	93
9.2	Wave Polarization . . . . .	96
9.2.1	General Polarizations—Elliptical and Circular Polarizations . . . . .	96
9.2.2	Arbitrary Polarization Case and Axial Ratio <sup>1</sup> . . . . .	98
9.3	Polarization and Power Flow . . . . .	100
<b>10</b>	<b>Momentum, Complex Poynting’s Theorem, Lossless Condition, Energy Density</b>	<b>103</b>
10.1	Spin Angular Momentum and Cylindrical Vector Beam . . . . .	104
10.2	Momentum Density of Electromagnetic Field . . . . .	105
10.3	Complex Poynting’s Theorem and Lossless Conditions . . . . .	106
10.3.1	Complex Poynting’s Theorem . . . . .	106
10.3.2	Lossless Conditions . . . . .	107
10.4	Energy Density in Dispersive Media <sup>2</sup> . . . . .	109
<b>11</b>	<b>Transmission Lines</b>	<b>113</b>
11.1	Transmission Line Theory . . . . .	114
11.1.1	Time-Domain Analysis . . . . .	115
11.1.2	Frequency-Domain Analysis—the Power of Phasor Technique Again! . . . . .	118
11.2	Lossy Transmission Line . . . . .	120
<b>12</b>	<b>More on Transmission Lines</b>	<b>123</b>
12.1	Terminated Transmission Lines . . . . .	123
12.1.1	Shorted Terminations . . . . .	126
12.1.2	Open Terminations . . . . .	127
12.2	Smith Chart . . . . .	128
12.3	VSWR (Voltage Standing Wave Ratio) . . . . .	130
<b>13</b>	<b>Multi-Junction Transmission Lines, Duality Principle</b>	<b>137</b>
13.1	Multi-Junction Transmission Lines . . . . .	137
13.1.1	Single-Junction Transmission Lines . . . . .	139
13.1.2	Two-Junction Transmission Lines . . . . .	140
13.1.3	Stray Capacitance and Inductance . . . . .	143
13.1.4	Multi-Port Network . . . . .	144
13.2	Duality Principle . . . . .	145
13.2.1	Unusual Swaps <sup>3</sup> . . . . .	146
13.2.2	Left-Handed Materials and Double Negative Materials . . . . .	146
13.3	Fictitious Magnetic Currents . . . . .	147

<sup>1</sup>This section is mathematically complicated. It can be skipped on first reading.

<sup>2</sup>The derivation in this section is complex, but worth the pain, since this knowledge was not discovered until the 1960s.

<sup>3</sup>This section can be skipped on first reading.

<b>14 Reflection, Transmission, and Interesting Physical Phenomena</b>	<b>149</b>
14.1 Reflection and Transmission—Single Interface Case . . . . .	149
14.1.1 TE Polarization (Perpendicular or E Polarization) <sup>4</sup> . . . . .	150
14.1.2 TM Polarization (Parallel or H Polarization) <sup>5</sup> . . . . .	153
14.1.3 Lens Optics and Ray Tracing . . . . .	153
14.2 Interesting Physical Phenomena . . . . .	154
14.2.1 Total Internal Reflection . . . . .	155
<b>15 Brewster Angle, SPP, Homomorphism with Transmission Lines</b>	<b>161</b>
15.1 Brewster’s Angle . . . . .	161
15.1.1 Surface Plasmon Polariton . . . . .	164
15.2 Homomorphism of Uniform Plane Waves and Transmission Lines Equations .	166
15.2.1 TE or TE <sub>z</sub> Waves . . . . .	167
15.2.2 TM or TM <sub>z</sub> Waves . . . . .	168
<b>16 Waves in Layered Media</b>	<b>171</b>
16.1 Waves in Layered Media . . . . .	171
16.1.1 Generalized Reflection Coefficient for Layered Media . . . . .	172
16.1.2 Ray Series Interpretation of Generalized Reflection Coefficient . . . .	173
16.2 Phase Velocity and Group Velocity . . . . .	174
16.2.1 Phase Velocity . . . . .	174
16.2.2 Group Velocity . . . . .	175
16.3 Wave Guidance in a Layered Media . . . . .	179
16.3.1 Transverse Resonance Condition . . . . .	179
<b>17 Dielectric Slab Waveguides</b>	<b>181</b>
17.1 Generalized Transverse Resonance Condition . . . . .	181
17.1.1 Parallel Plate Waveguide . . . . .	182
17.2 Dielectric Slab Waveguide . . . . .	182
17.2.1 TE Case . . . . .	183
17.2.2 TM Case . . . . .	189
17.2.3 A Note on Cut-Off of Dielectric Waveguides . . . . .	190
<b>18 Hollow Waveguides</b>	<b>191</b>
18.1 General Information on Hollow Waveguides . . . . .	191
18.1.1 Absence of TEM Mode in a Hollow Waveguide . . . . .	192
18.1.2 TE Case ( $E_z = 0$ , $H_z \neq 0$ , TE <sub>z</sub> case) . . . . .	193
18.1.3 TM Case ( $E_z \neq 0$ , $H_z = 0$ , TM <sub>z</sub> Case) . . . . .	195
18.2 Rectangular Waveguides . . . . .	196
18.2.1 TE Modes ( $H_z \neq 0$ , H Modes or TE <sub>z</sub> Modes) . . . . .	196

<sup>4</sup>These polarizations are also variously known as TE<sub>z</sub>, or the *s* and *p* polarizations, a descendent from the notations for acoustic waves where *s* and *p* stand for shear and pressure waves, respectively.

<sup>5</sup>Also known as TM<sub>z</sub> polarization.

<b>19 More on Hollow Waveguides</b>	<b>199</b>
19.1 Rectangular Waveguides, Contd. . . . .	200
19.1.1 TM Modes ( $E_z \neq 0$ , E Modes or $TM_z$ Modes) . . . . .	200
19.1.2 Bouncing Wave Picture . . . . .	201
19.1.3 Field Plots . . . . .	202
19.2 Circular Waveguides . . . . .	204
19.2.1 TE Case . . . . .	204
19.2.2 TM Case . . . . .	206
<b>20 More on Waveguides and Transmission Lines</b>	<b>211</b>
20.1 Circular Waveguides, Contd. . . . .	211
20.1.1 An Application of Circular Waveguide . . . . .	212
20.2 Remarks on Quasi-TEM Modes, Hybrid Modes, and Surface Plasmonic Modes	215
20.2.1 Quasi-TEM Modes . . . . .	216
20.2.2 Hybrid Modes—Inhomogeneously-Filled Waveguides . . . . .	217
20.2.3 Guidance of Modes . . . . .	218
20.3 Homomorphism of Waveguides and Transmission Lines . . . . .	219
20.3.1 TE Case . . . . .	219
20.3.2 TM Case . . . . .	221
20.3.3 Mode Conversion . . . . .	222
<b>21 Cavity Resonators</b>	<b>225</b>
21.1 Transmission Line Model of a Resonator . . . . .	225
21.2 Cylindrical Waveguide Resonators . . . . .	228
21.2.1 $\beta_z = 0$ Case for Cylindrical Waveguides . . . . .	230
21.2.2 Lowest Mode of a Rectangular Cavity . . . . .	230
21.3 Some Applications of Resonators . . . . .	232
21.3.1 Filters . . . . .	232
21.3.2 Electromagnetic Sources . . . . .	234
21.3.3 Frequency Sensor . . . . .	237
<b>22 Quality Factor of Cavities, Mode Orthogonality</b>	<b>239</b>
22.1 The Quality Factor of a Cavity—General Concept . . . . .	239
22.1.1 Analogue with an LC Tank Circuit . . . . .	240
22.1.2 Relation to Bandwidth and Pole Location . . . . .	243
22.1.3 Wall Loss and $Q$ for a Metallic Cavity—A Perturbation Concept . . .	244
22.1.4 Example: The $Q$ of $TM_{110}$ Mode . . . . .	246
22.2 Mode Orthogonality and Matrix Eigenvalue Problem . . . . .	248
22.2.1 Matrix Eigenvalue Problem (EVP) . . . . .	248
22.2.2 Homomorphism with the Waveguide Mode Problem . . . . .	249
22.2.3 Proof of Orthogonality of Waveguide Modes <sup>6</sup> . . . . .	250

---

<sup>6</sup>This may be skipped on first reading.

<b>23</b>	<b>Scalar and Vector Potentials</b>	<b>253</b>
23.1	Scalar and Vector Potentials for Time-Harmonic Fields . . . . .	253
23.2	Scalar and Vector Potentials for Statics—A Review . . . . .	254
23.2.1	Scalar and Vector Potentials for Electrodynamics . . . . .	255
23.2.2	More on Scalar and Vector Potentials . . . . .	257
23.3	When is Static Electromagnetic Theory Valid? . . . . .	258
23.3.1	Cutting Through The Chaste . . . . .	259
23.3.2	Dimensional Analysis Approach and Coordinate Stretching <sup>7</sup> . . . . .	260
23.3.3	Quasi-Static Electromagnetic Theory . . . . .	264
<b>24</b>	<b>Circuit Theory Revisited</b>	<b>267</b>
24.1	Kirchhoff Current Law . . . . .	267
24.2	Kirchhoff Voltage Law . . . . .	268
24.3	Inductor . . . . .	272
24.4	Capacitance . . . . .	273
24.5	Resistor . . . . .	274
24.6	Some Remarks . . . . .	274
24.7	Energy Storage Method for Inductor and Capacitor . . . . .	275
24.8	Finding Closed-Form Formulas for Inductance and Capacitance . . . . .	275
24.9	Importance of Circuit Theory in IC Design . . . . .	278
24.10	Decoupling Capacitors and Spiral Inductors . . . . .	280
<b>25</b>	<b>Radiation by a Hertzian Dipole</b>	<b>283</b>
25.1	History . . . . .	283
25.2	Approximation by a Point Source . . . . .	285
25.2.1	Case I. Near Field, $\beta\mathbf{r} \ll \mathbf{1}$ . . . . .	287
25.2.2	Case II. Far Field (Radiation Field), $\beta\mathbf{r} \gg \mathbf{1}$ . . . . .	288
25.3	Radiation, Power, and Directive Gain Patterns . . . . .	289
25.3.1	Radiation Resistance . . . . .	291
<b>26</b>	<b>Radiation Fields, Directive Gain, Effective Aperture</b>	<b>295</b>
26.1	Radiation Fields or Far-Field Approximation . . . . .	297
26.1.1	Far-Field Approximation . . . . .	298
26.1.2	Locally Plane Wave Approximation . . . . .	299
26.1.3	Directive Gain Pattern Revisited . . . . .	302
26.2	Effective Aperture and Directive Gain . . . . .	303
<b>27</b>	<b>Array Antennas, Fresnel Zone, Rayleigh Distance</b>	<b>305</b>
27.1	Linear Array of Dipole Antennas . . . . .	305
27.1.1	Far-Field Approximation of a Linear Array . . . . .	307
27.1.2	Radiation Pattern of an Array . . . . .	307
27.2	Validity of the Far-Field Approximation . . . . .	310
27.2.1	Rayleigh Distance . . . . .	312
27.2.2	Near Zone, Fresnel Zone, and Far Zone . . . . .	313

---

<sup>7</sup>This can be skipped on first reading.

<b>28 Different Types of Antennas—Heuristics</b>	<b>315</b>
28.1 Resonance Tunneling in Antenna . . . . .	316
28.2 Horn Antennas . . . . .	319
28.3 Quasi-Optical Antennas . . . . .	321
28.4 Small Antennas . . . . .	323
<b>29 Uniqueness Theorem</b>	<b>329</b>
29.1 The Difference Solutions to Source-Free Maxwell's Equations . . . . .	329
29.2 Conditions for Uniqueness . . . . .	332
29.2.1 Isotropic Case . . . . .	332
29.2.2 General Anisotropic Case . . . . .	333
29.3 Hind Sight Using Linear Algebra . . . . .	334
29.4 Connection to Poles of a Linear System . . . . .	335
29.5 Radiation from Antenna Sources and Radiation Condition . . . . .	337
<b>30 Reciprocity Theorem</b>	<b>341</b>
30.1 Mathematical Derivation . . . . .	342
30.1.1 Lorentz Reciprocity Theorem . . . . .	344
30.1.2 Reaction Reciprocity Theorem . . . . .	344
30.2 Conditions for Reciprocity . . . . .	345
30.3 Application to a Two-Port Network and Circuit Theory . . . . .	345
30.4 Voltage Sources in Electromagnetics . . . . .	348
30.5 Hind Sight . . . . .	349
30.6 Transmit and Receive Patterns of an Antenna . . . . .	350
30.6.1 Effective Gain versus Directive Gain . . . . .	350
30.6.2 Effective Aperture . . . . .	351
<b>31 Equivalence Theorems, Huygens' Principle</b>	<b>355</b>
31.1 Equivalence Theorems or Equivalence Principles . . . . .	355
31.1.1 Inside-Out Case . . . . .	356
31.1.2 Outside-in Case . . . . .	357
31.1.3 General Case . . . . .	357
31.2 Electric Current on a PEC . . . . .	358
31.3 Magnetic Current on a PMC . . . . .	359
31.4 Huygens' Principle and Green's Theorem . . . . .	359
31.4.1 Scalar Waves Case . . . . .	360
31.4.2 Electromagnetic Waves Case . . . . .	363
<b>32 Shielding, Image Theory</b>	<b>367</b>
32.1 Shielding . . . . .	367
32.1.1 A Note on Electrostatic Shielding . . . . .	367
32.1.2 Relaxation Time . . . . .	368
32.2 Image Theory . . . . .	370
32.2.1 Electric Charges and Electric Dipoles . . . . .	370
32.2.2 Magnetic Charges and Magnetic Dipoles . . . . .	372

32.2.3	Perfect Magnetic Conductor (PMC) Surfaces . . . . .	374
32.2.4	Multiple Images . . . . .	375
32.2.5	Some Special Cases—Spheres, Cylinders, and Dielectric Interfaces . . . . .	376
<b>33</b>	<b>High Frequency Solutions, Gaussian Beams</b>	<b>379</b>
33.1	Tangent Plane Approximations . . . . .	380
33.2	Fermat's Principle . . . . .	381
33.2.1	Generalized Snell's Law . . . . .	383
33.3	Gaussian Beam . . . . .	384
33.3.1	Derivation of the Paraxial/Parabolic Wave Equation . . . . .	384
33.3.2	Finding a Closed Form Solution . . . . .	385
33.3.3	Other solutions . . . . .	387
<b>34</b>	<b>Scattering of Electromagnetic Field</b>	<b>391</b>
34.1	Rayleigh Scattering . . . . .	391
34.1.1	Scattering by a Small Spherical Particle . . . . .	393
34.1.2	Scattering Cross Section . . . . .	395
34.1.3	Small Conductive Particle . . . . .	398
34.2	Mie Scattering . . . . .	399
34.2.1	Optical Theorem . . . . .	400
34.2.2	Mie Scattering by Spherical Harmonic Expansions . . . . .	401
34.2.3	Separation of Variables in Spherical Coordinates <sup>8</sup> . . . . .	401
<b>35</b>	<b>Spectral Expansions of Source Fields—Sommerfeld Integrals</b>	<b>405</b>
35.1	Spectral Representations of Sources . . . . .	405
35.1.1	A Point Source—Fourier Expansion and Contour Integration . . . . .	406
35.2	A Source on Top of a Layered Medium . . . . .	411
35.2.1	Electric Dipole Fields—Spectral Expansion . . . . .	412
35.3	Stationary Phase Method—Fermat's Principle . . . . .	414
<b>36</b>	<b>Computational Electromagnetics, Numerical Methods</b>	<b>419</b>
36.1	Computational Electromagnetics, Numerical Methods . . . . .	421
36.2	Examples of Differential Equations . . . . .	421
36.3	Examples of Integral Equations . . . . .	422
36.3.1	Volume Integral Equation . . . . .	422
36.3.2	Surface Integral Equation . . . . .	424
36.4	Function as a Vector . . . . .	425
36.5	Operator as a Map . . . . .	426
36.5.1	Domain and Range Spaces . . . . .	426
36.6	Approximating Operator Equations with Matrix Equations . . . . .	427
36.6.1	Subspace Projection Methods . . . . .	427
36.6.2	Dual Spaces . . . . .	428
36.6.3	Matrix and Vector Representations . . . . .	428
36.6.4	Mesh Generation . . . . .	429

---

<sup>8</sup>May be skipped on first reading.

36.6.5	Differential Equation Solvers versus Integral Equation Solvers . . . . .	430
36.7	Solving Matrix Equation by Optimization . . . . .	431
36.7.1	Gradient of a Functional . . . . .	432
<b>37</b>	<b>Finite Difference Method, Yee Algorithm</b>	<b>435</b>
37.1	Finite-Difference Time-Domain Method . . . . .	435
37.1.1	The Finite-Difference Approximation . . . . .	436
37.1.2	Time Stepping or Time Marching . . . . .	438
37.1.3	Stability Analysis . . . . .	440
37.1.4	Grid-Dispersion Error . . . . .	442
37.2	The Yee Algorithm . . . . .	444
37.2.1	Finite-Difference Frequency Domain Method . . . . .	448
37.3	Absorbing Boundary Conditions . . . . .	448
<b>38</b>	<b>Quantum Theory of Light</b>	<b>451</b>
38.1	Historical Background on Quantum Theory . . . . .	451
38.2	Connecting Electromagnetic Oscillation to Simple Pendulum . . . . .	454
38.3	Hamiltonian Mechanics . . . . .	457
38.4	Schrödinger Equation (1925) . . . . .	459
38.5	Some Quantum Interpretations—A Preview . . . . .	462
38.5.1	Matrix or Operator Representations . . . . .	463
38.6	Bizarre Nature of the Photon Number States . . . . .	464
<b>39</b>	<b>Quantum Coherent State of Light</b>	<b>467</b>
39.1	The Quantum Coherent State . . . . .	467
39.1.1	Quantum Harmonic Oscillator Revisited—Creation and Annihilation Operators . . . . .	468
39.2	Some Words on Quantum Randomness and Quantum Observables . . . . .	470
39.3	Derivation of the Coherent States . . . . .	471
39.3.1	Time Evolution of a Quantum State . . . . .	473
39.4	More on the Creation and Annihilation Operator . . . . .	475
39.4.1	The Correspondence Principle for a Pendulum . . . . .	476
39.4.2	Connecting Quantum Pendulum to Electromagnetic Oscillator <sup>9</sup> . . . . .	478
39.5	Epilogue . . . . .	480

---

<sup>9</sup>May be skipped on first reading.

# Preface

This set of lecture notes is from my teaching of ECE 604, Electromagnetic Field Theory, at ECE, Purdue University, West Lafayette. It is intended for entry level graduate students. Because different universities have different undergraduate requirements in electromagnetic field theory, this is a course intended to “level the playing field”. From this point onward, hopefully, all students will have the fundamental background in electromagnetic field theory needed to take advance level courses and do research at Purdue.

In developing this course, I have drawn heavily upon knowledge of our predecessors in this area. Many of the textbooks and papers used, I have listed them in the reference list. Being a practitioner in this field for over 40 years, I have seen electromagnetic theory impacting modern technology development unabated. Despite its age, the set of Maxwell’s equations has endured and continued to be important, from statics to optics, from classical to quantum, and from nanometer lengthscales to galactic lengthscales. The applications of electromagnetic technologies have also been tremendous and wide-ranging: from geophysical exploration, remote sensing, bio-sensing, electrical machinery, renewable and clean energy, biomedical engineering, optics and photonics, computer chip, computer system, and quantum computer designs, quantum communication and many more. Electromagnetic field theory is not everything, but it remains an important component of modern technology developments.

The challenge in teaching this course is on how to teach over 150 years of knowledge in one semester: Of course this is mission impossible! To do this, we use the traditional wisdom of engineering education: Distill the knowledge, make it as simple as possible, and teach the fundamental big ideas in one short semester. Because of this, you may find the flow of the lectures erratic. Some times, I feel the need to touch on certain big ideas before moving on, resulting in the choppiness of the curriculum.

Also, in this course, I exploit mathematical homomorphism as much as possible to simplify the teaching. After years of practising in this area, I find that some complex and advanced concepts become simpler if mathematical homomorphism is exploited between the advanced concepts and simpler ones. An example of this is on waves in layered media. The problem is homomorphic to the transmission line problem: Hence, using transmission line theory, one can simplify the derivations of some complicated formulas.

A large part of modern electromagnetic technologies is based on heuristics. This is something difficult to teach, as it relies on physical insight and experience. Modern commercial software has reshaped this landscape, as the field of math-physics modeling through numerical simulations, known as computational electromagnetic (CEM), has made rapid advances in recent years. Many cut-and-try laboratory experiments, based on heuristics, have been

replaced by cut-and-try computer experiments, which are a lot cheaper.

An exciting modern development is the role of electromagnetics and Maxwell's equations in quantum technologies. We will connect Maxwell's equations to them toward the end of this course. This is a challenge, as it has never been done before at an entry level course to my knowledge.

## **Acknowledgements**

I like to thank Dan Jiao for sharing her lecture notes in this course, as well as Andy Weiner for sharing his experience in teaching this course. Mark Lundstrom gave me useful feedback on Lectures 38 and 39 on the quantum theory of light. Also, I am thankful to Dong-Yeop Na for helping teach part of this course. Robert Hsueh-Yung Chao also took time to read the lecture notes and gave me very useful feedback.
