Connected Component Analysis

- Once region boundaries have been detected, it is often useful to extract regions which are not separated by a boundary.
- Any set of pixels which is not separated by a boundary is call connected.
- Each maximal region of connected pixels is called a connected component.
- The set of connected components partition an image into segments.
- Image segmentation is an useful operation in many image processing applications.

Connected Neighbors

- Let ∂s be a neighborhood system.
  - 4-point neighborhood system
  - 8-point neighborhood system
- Let $c(s)$ be the set of neighbors that are connected to the point s.

  For all s and r, the set $c(s)$ must have the properties that
  - $c(s) \subset \partial s$
  - $r \in c(s) \Leftrightarrow s \in c(r)$
- Example:

$$c(s) = \{r \in \partial s : X_r = X_s\}$$

- Example:

$$c(s) = \{r \in \partial s : |X_r - X_s| < Threshold\}$$

- In general, computation of $c(s)$ might be very difficult, but we won't worry about that now.

Connected Sets

- Definition: A region $R \subset S$ is said to be connected under $c(s)$ if for all $s, r \in R$ there exists a sequence of M pixels, $s_1, \cdots, s_M$ such that

  $$s_1 \in c(s), s_2 \in c(s_1), \cdots, s_M \in c(s_{M-1}), r \in c(s_M)$$

  i.e. there is a connected path from s to r.

Example of Connect Sets

- Consider the following image X_s

$$
\begin{array}{cccccc}
1 & 1 & 1 & 0 & 0 & 0 \\
1 & 1 & 1 & 0 & 0 & 0 \\
1 & 1 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 1 & 1 \\
0 & 0 & 0 & 1 & 1 & 1 \\
0 & 0 & 0 & 1 & 1 & 1
\end{array}
\qquad
\begin{aligned}
S_1 &= \{s : X_s = 1\} \\
S_0 &= \{s : X_s = 0\}
\end{aligned}
$$

- Define $c(s) = \{r \in \partial s : X_r = X_s\}$
- Result
  - 4-point neighborhood $\Rightarrow S_0$ and S_1 are not connected sets
  - 8-point neighborhood $\Rightarrow S_0$ and S_1 **are** connected sets!

Region Growing

- Idea - Find a connected set by growing a region from a seed point s_0
- Assume that $c(s)$ is given

$ClassLabel = 1$

Initialize $Y_r = 0$ for all $r \in S$

ConnectedSet($s_0, Y, ClassLabel$) {

  $B \leftarrow \{s_0\}$

  While B is not empty {

    $s \leftarrow$ any element of B

    $B \leftarrow B - \{s\}$

    $Y_s \leftarrow ClassLabel$

    $B \leftarrow B \bigcup \{r : r \in c(s)$ and $Y_r = 0\}$

  }

  return(Y)

}
