

Chapter 5 Pairs of R.V.s.

Consider a R.V X with sample space $S_x = \{0, 1\}$ and another R.V Y with $S_y = \{0, 1, 2\}$.

To discuss the joint relationship of X and Y , we need to consider the [joint sample space]

$$S_{xy} = \{(0, 0)^{\frac{1}{6}}, (0, 1)^{\frac{1}{6}}, (0, 2)^{\frac{1}{6}}, (1, 0)^{\frac{1}{6}}, (1, 1)^{\frac{1}{6}}, (1, 2)^{\frac{1}{6}}\}$$

Once the W.A of S_{xy} is made,

We can compute any prob like

$$P(X^2 \leq Y), P(\max(X, Y) \leq 3) \dots$$

Note that

$$\text{Even } E(X^2 Y)$$

It is no different than considering

a Random Vector $W = (X, Y)$ where

the output of each W is a vector.

Nonetheless, it is not efficient to always
3/7/2011

assign the Weight for the joint sample space as most of the time, we are interested only in $P(X > 0)$, $P(\sqrt{X} < 3)$

$E(X^{\frac{3}{2}})$. In most cases, we do the W.A gradually, start from the W.A of X , then extend to (X, Y) . We say the W.A for X alone is

the marginal distribution.

	0	1	2	
X \ Y	0	$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$
0	$\frac{1}{4}$	0	$\frac{1}{4}$	
1	$\frac{5}{12}$	$\frac{2}{12}$	$\frac{5}{12}$	

marginal distribution
of X

marginal distribution

Marginal distribution

joint distribution

conditional distribution

marginal + conditional

joint

the key

concept of every

Computation

Note 1: marginal + marginal \Rightarrow joint. [138]

		Y			$\frac{1}{2}$
		0	1	$>$	
X	0	$\frac{5}{24}$	$\frac{2}{24}$	$\frac{5}{24}$	$\frac{1}{2}$
	1	$\frac{5}{24}$	$\frac{2}{24}$	$\frac{5}{24}$	$\frac{1}{2}$

$\frac{5}{12} \quad \frac{2}{12} \quad \frac{5}{12}$

has the same marginal distributions as the first example. but different joint distribution.

Ex HW10Q8

X is geometric with p.

→ The marginal distribution

Given $X = X_0$, Y is a Poisson with

$$\alpha = X_0$$

→ The conditional distribution

Q: The joint sample space = ?

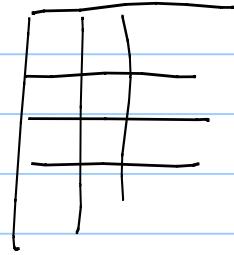

Ans: $S_{XY} = \{ \text{all pairs of non-negative integers}$
 $(0,0), (0,1), (0,2), \dots$
 $(1,0), (1,1), \dots \}$

Q: What is the joint W.A?

$$P(X=k, Y=h)$$

$$= \underbrace{P(Y=h | X=k)}_{\text{joint}} \cdot \underbrace{P(X=k)}_{\text{marginal}}$$

(think about the tree method)
table

$$= \begin{cases} \left(\frac{k^h}{h!} e^{-k} \right) \cdot p(1-p)^k & \text{if } 0 \leq h \\ 0 & \text{otherwise} \end{cases}$$

Q: What is the marginal W.A of X?

A: Summing over all Y values

$$\begin{aligned} P(X=k) &= \sum_{h=0}^{\infty} P(X=k, Y=h) = 1 \\ &= \begin{cases} p(1-p)^k \sum_{h=0}^{\infty} \frac{k^h}{h!} e^{-k} & \text{if } k \geq 0 \\ 0 & \text{if } k < 0. \end{cases} \end{aligned}$$

Q: How to compute the marginal distribution of Y?

Ans: Summing over X's

$$P(Y=h) = \sum_{k=0}^{\infty} P(X=k, Y=h)$$

$$\begin{aligned}
 &= \left\{ \sum_{k=0}^{\infty} \frac{k^h}{h!} e^{-k} p^k (1-p)^{k-h} \right. \\
 &\quad \left. = \frac{p^h}{h!} \sum_{k=0}^{\infty} k^h e^{-k} (1-p)^k \right. \\
 &\quad \left. \text{if } h \geq 0 \right. \\
 &\quad \left. 0 \right. \text{if } h < 0
 \end{aligned}$$

The computation of the sum is not easy.

$$\text{Ex: } P(Y=0) = \frac{p}{0!} \sum_{k=0}^{\infty} \binom{k}{0} e^{-k} (1-p)^k$$

$$= p \times \frac{1}{1 - e^{-1}(1-p)}$$

$$P(Y=1) = \frac{p}{1!} \sum_{k=0}^{\infty} \binom{k}{1} e^{-k} (1-p)^k$$

$$= \frac{p}{1!} \times \frac{e^{-1}(1-p)}{(1 - e^{-1}(1-p))^2}$$

* The geometric series formulas

* But the concept is straightforward

$$Q: P(X^2 + Y^2 \leq 4)$$

$$\text{Ans: } P((0,0), (0,1), (0,2), (1,0), (1,1), (2,0)) = 6 \text{ terms.}$$

Independence

Two (marginal) R.Vs X and Y are independent. If their joint weight assignment is the product of the marginal probabilities.

That is

$$P(X=k, Y=h) = P(X=k) \cdot \boxed{P(Y=h)}$$

Comparison, if not independent

$$P(X=k, Y=h) = P(X=k) \cdot \boxed{P(Y=h | X=k)}$$

$$\Rightarrow \begin{matrix} \text{marginal + conditional} \\ \text{marginal + marginal + indep} \end{matrix} \Rightarrow \begin{matrix} \text{joint} \\ \cancel{\text{joint}} \end{matrix}$$

Note: Relate it to the tree / table method we have learned so far.

* Discrete 2-dim R.V.s.

$$S_{XY} = \{(-1, 0), (-1, 1), (0, -1), (0, 1), (1, 0), \dots\}$$

all grid points }

The Joint W.A is specified by the joint pmf : $p_{k,h} = P(X=k, Y=h)$

$$\text{s.t. } p_{k,h} \geq 0$$

$$\sum_{k=-\infty}^{\infty} \sum_{h=-\infty}^{\infty} p_{k,h} = 1.$$

* From joint distribution to marginal distri

$$P(Y=h) = \sum_{k=-\infty}^{\infty} p_{k,h} \quad \begin{matrix} \text{summing over} \\ \text{Uninterested} \\ \text{variable} \end{matrix}$$

focusing on the column

* Expectation of a function of a 2-dim R.V

$$E(f(X, Y)) \quad \text{say } f(x, y) = x^2 + y^2$$

$$\tilde{E} \sum_k \sum_n f(k, h) \underbrace{p_{k,h}}_{\text{Weight}}$$

$$E(X^2 + XY + Y^2)$$

$$Q: E(U(1-X-Y))$$

$$U(1-X-Y) = \begin{cases} 1 & \text{if } 1-X-Y \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

$$\text{Ans} = 1 \times p_{0,0} + 1 \times p_{0,1} + 1 \times p_{1,0} + 0 \dots$$

= 3 terms

HW10Q8

 X is geometric with p .

→ The marginal distribution

Given $X=x_0$, Y is a Poisson with

$$\alpha = x_0$$

→ The conditional distribution

$$Q: E(X) = ?$$

Ans: $\frac{1-p}{p}$ by table look-up since the

(marginal) distribution of X is geometric

$$Q: E(Y) = ?$$

Ans: We can compute either

$$\textcircled{1} \quad \sum_{y=0}^{\infty} y P(Y=y) \quad \text{hard, we don't even know } P(Y=y)$$

$$\text{Or } \textcircled{2} \quad \sum_{x=0}^{\infty} \sum_{y=0}^{\infty} y P(X=x, Y=y) = \sum_{y=0}^{\infty} y \sum_{x=0}^{\infty} P(X=x, Y=y)$$

The difference is how you compute the weighted average, in a "① column by column" way or "② block by block" way

$$\text{from ②} \Rightarrow \sum_{x=0}^{\infty} \sum_{y=0}^{\infty} y \cdot \frac{x^y}{y!} e^{-x} p^x (1-p)^{x-y}$$

$$= \sum_{X=0}^{\infty} X p(1-p)^X$$

by table look up for the expected value of a Poisson

$$= \frac{1-p}{p} \text{ by another table look up.}$$

Summary: For 2-dim R.Vs, there

are many ways of "counting the weights"

Some are easier than the others.

* Conditional distribution for discrete variables

$P(X=k | Y=h)$ focusing on the h-th col.

$$= \frac{P(X=k, Y=h)}{P(Y=h)}$$

$$= \frac{p_{k,h}}{\sum_{x=-\infty}^{\infty} p_{x,h}}$$

Exercise: $P(Y=h | X=k) = \frac{p_{k,h}}{\sum_{y=-\infty}^{\infty} p_{k,y}}$

Summary

Note Title

3/9/2011

* Discrete 2-dim R.Vs.

$S_{X,Y} = \{ \text{all grid points} \}$

W.A: $p_{k,h} = P(X=k, Y=h)$ (2-dim) joint pmf

Expectation $E(g(X, Y))$

$$= \sum_k \sum_h g(k, h) p_{k,h}$$

Marginal pmf $P(X=k) = p_k = \sum_{h=-\infty}^{\infty} p_{k,h}$

swimming over the row
of interest.

$$P(Y=h) = p_h = \sum_{k=-\infty}^{\infty} p_{k,h}$$

Conditional pmf

$$p_{k|h} = P(X=k | Y=h)$$

$$\triangleq \frac{p_{k,h}}{\sum_{x=-\infty}^{\infty} p_{x,h}}$$

Conditional expectation?

Conditional pmf + expectation.

* Continuous 2-dim Random variables.

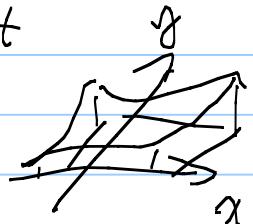

$S_{XY} = \{ \text{all pairs of real numbers } (-\infty, \infty) \times (-\infty, \infty) \}$

say $(0, 1, 1001.5), (\pi, e) \dots$

The joint W.A is specified by the joint

pdf: $f_{XY}(x, y)$ such that

$$f_{XY}(x, y) \geq 0$$

$$\iint_{-\infty}^{\infty} f_{XY}(x, y) dx dy = 1$$

$$P((X, Y) \in A)$$

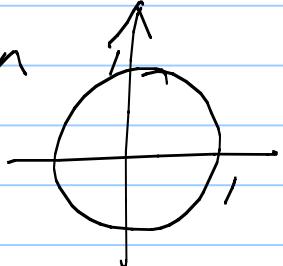

\Rightarrow falls in / belongs to

$$= \iint_A f_{XY}(x, y) dx dy$$

Problem 5.28(i)

Ex: HW11Q3. A joint pdf is given as follows $f_{XY}(x, y) = k$ if (x, y) in

0 otherwise.

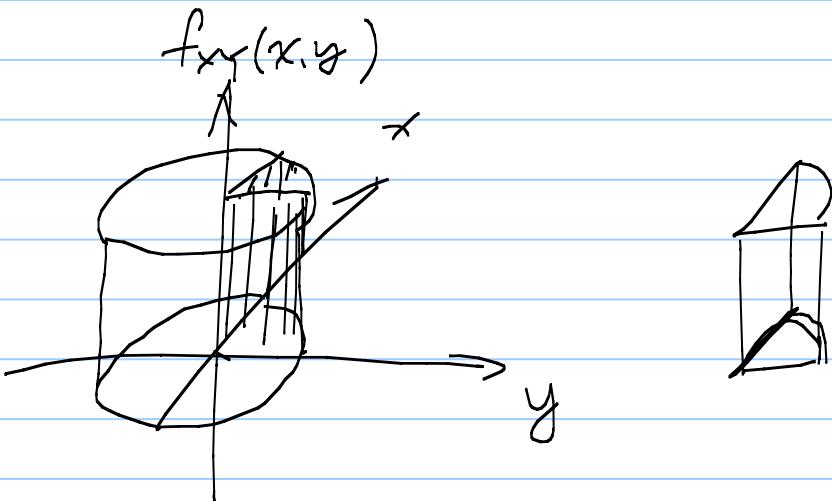

Q: find the k value.

147

$$\Rightarrow k \cdot \pi r^2 = 1 \Rightarrow k = \frac{1}{\pi}.$$

Q: Find $P(X > 0, Y > 0)$?

$$\text{Ans: } = k \cdot \left(\frac{1}{4}\pi r^2\right) = \frac{1}{4}$$

* Another example.

Ex: $f_{XY}(x,y) = \begin{cases} kxy & \text{if } 0 < x < 1 \\ & \text{and } 0 < y < 1 \\ 0 & \text{otherwise} \end{cases}$

is a joint pdf, find k value.

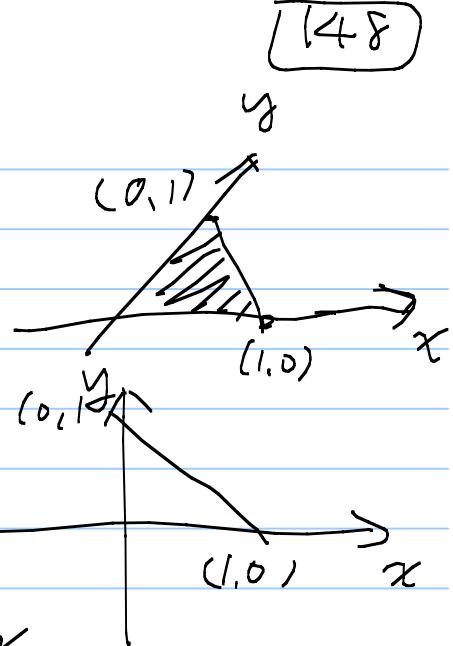

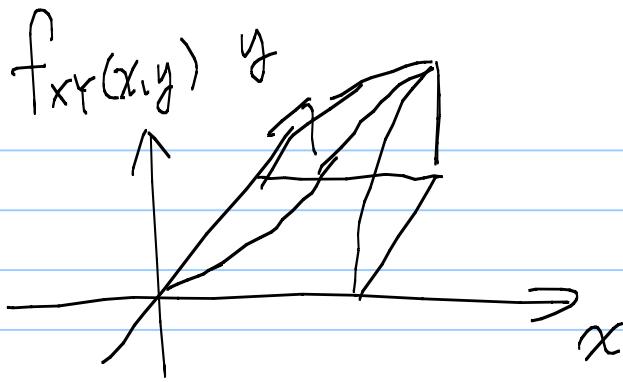

$$\textcircled{1} \quad P(X+Y \leq 1)$$

$$\text{Ans: } \textcircled{2} \quad \int_0^1 \int_0^1 kxy \, dx \, dy = 1$$

$$\Rightarrow \int_0^1 k y \left(\frac{x^2}{2} \Big|_0^1 \right) dy$$

$$\Rightarrow k = 4$$

$$= \int_0^1 \frac{1}{2} k y dy = \frac{1}{2} k \left(\frac{y^2}{2} \Big|_0^1 \right) = \frac{k}{4}$$

Q2:

$$P(X+Y \leq 1) = \int_{x=0}^1 \int_{y=0}^{1-x} 4xy \, dy \, dx$$

$$= \int_{x=0}^1 4x \left(\frac{y^2}{2} \Big|_0^{1-x} \right) \, dx$$

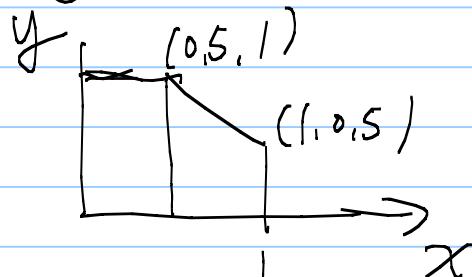

$$= \int_{x=0}^1 4x \cdot \frac{(1-x)^2}{2} \, dx$$

$$= \int_{x=0}^1 2x - 4x^2 + 2x^3 \, dx$$

$$= x^2 - \frac{4}{3}x^3 + \frac{2}{4}x^4 \Big|_0^1 = \frac{1}{6} \quad \times$$

Exercise $P(X+Y \leq 1.5) = ?$

Ans: $\iint_D 4xy \, dy \, dx$

$$= \iint_{\square} 4xy \, dy \, dx + \iint_{\square} 4xy \, dy \, dx$$

$$= \int_0^{0.5} \int_0^1 4xy \, dy \, dx + \int_{0.5}^1 \int_0^{1-x} 4xy \, dy \, dx$$

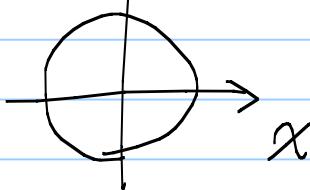

=

* From joint pdf to marginal pdf.

knowing $f_{XY}(x, y)$ how to construct
 $f_X(x)$ (or $f_Y(y)$)

Ans: Integrating over uninterested variable.

Ex: HWI (Q3) Problem 5.28(i) ^{of}

$$f_{XY}(x, y) = \begin{cases} \frac{1}{\pi} & \text{if } \\ 0 & \text{otherwise.} \end{cases}$$

Find the marginal $f_Y(y)$.

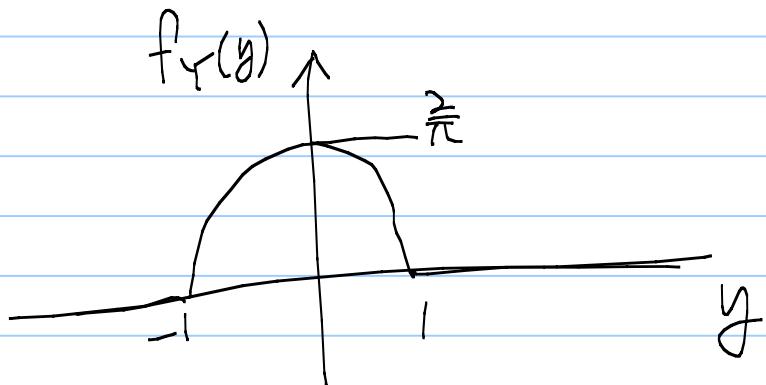

$$\text{Ans: } f_Y(y) = \int_{x=-\infty}^{\infty} f_{XY}(x, y) dx$$

$$= \begin{cases} 0 & \text{if } y < -1 \\ \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} \frac{1}{\pi} dx & \text{if } -1 \leq y < 1 \\ 0 & \text{if } y \geq 1 \end{cases}$$

$$= \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} \frac{1}{\pi} dx$$

$$= \frac{2\sqrt{1-y^2}}{\pi}$$

if $1 \leq y$
