Midterm #1 of ECE301-003, 004 (CRN 17101, 17102)
8–9pm, Thursday, September 12, 2019, LILY 1105.

1. Please make sure that it is your name printed on the exam booklet. Enter your student ID number, and signature in the space provided on this page, **NOW!**

2. This is a closed book exam.

3. This exam contains multiple choice questions and work-out questions. For multiple choice questions, there is no need to justify your answers. You have one hour to complete it. The students are suggested not spending too much time on a single question, and working on those that you know how to solve.

4. Use the back of each page for rough work.

5. Neither calculators nor help sheets are allowed.

Name:

Question 1: [20%, Work-out question, Learning Objectives 1 and 2] Consider two DT signals:

$$x_1[n] = (U[n+2] - U[n-4]) \cdot n^2 + 3 \cdot \delta[n+3] \cdot n \tag{1}$$

$$x_2(t) = U(-t+2) \cdot e^{jt^2} \cdot (\sin(t) - j\cos(t)) \cdot 2^t. \tag{2}$$

Plot

1. [5%] Plot $x_1[n]$ for the range of $-5 \le n \le 5$.

2. [7%] Plot the even part of $x_1[n]$ for the range of $-5 \le n \le 5$.

   Hint: If you do not know how to solve this question, write down the formulas of the odd part of $x_1[n]$. You will receive 3 points if your answer is correct.

3. [8%] Compute the *total energy* of $x_2(t)$.

Question 2: [16%, Work-out question, Learning Objective 3]

Define two DT signals:

$$x[n] = \begin{cases} 5^{(n-100)} & \text{if } n \le 100 \\ 0 & \text{otherwise} \end{cases}, \tag{3}$$

and

$$h[n] = 3^{-|n-20|}. \tag{4}$$

Compute the expression of the following sum

$$z[n] = \sum_{k=-\infty}^{\infty} x[k]h[n-k] \tag{5}$$

Hint 1: You can leave your answer to be of the form like $\frac{e^{3j}-2^{-12}}{3+10j}$. There is no need to further simplify the expression.

Hint 2: If $|r| < 1$, then we have the following formulas for computing the infinite sum of a geometric sequence.

$$\sum_{k=1}^{\infty} ar^{k-1} = \frac{a}{1-r}$$

$$\sum_{k=1}^{\infty} kar^{k-1} = \frac{a}{(1-r)^2}.$$

If $r \ne 1$, then we have the following formula for computing the finite sum of a geometric sequence.

$$\sum_{k=1}^{K} ar^{k-1} = \frac{a(1-r^K)}{1-r}.$$

Hint 3: **If you do not know how to carefully carry out the summation or if you do not have time to carry out the summation,** you can leave your answer to be something like:

$$z[n] = \begin{cases} \sum_{k=n-10}^{40} 2^{n-k} + \sum_{k=50}^{\infty} 2^{k-n} & \text{if } n \le 50 \\ \sum_{k=0}^{\infty} 2^{k-n} & \text{otherwise} \end{cases} \tag{6}$$

You will still receive 11 points if your answers are correct.

Question 3: [22%, Work-out question, Learning Objectives 1, 4, and 5] Consider a CT signal

$$h(t) = \begin{cases} e^{(j-1)t} & \text{if } 0 \le t \le 1 \\ 1 & \text{if } -10 < t < 0 \\ 0 & \text{otherwise} \end{cases} \tag{7}$$

Based on $h(t)$, we construct another signal

$$y(t) = \int_{s=-\infty}^{\infty} h(s)e^{j\omega(t-s)}ds \tag{8}$$

where we assume ω is an arbitrarily given constant.

1. [14%] Find the expression of $y(t)$ for arbitrarily given ω.

   Hint 1: Your answer of $y(t)$ should still have ω inside. Namely, for any different ω value, we will have a different $y(t)$. We are interested in a general formula of $y(t)$ for arbitrary ω.

2. [8%] Write down the expression of $y(t)$ when $\omega = 10\pi$ and carefully explain whether $y(t)$ (assuming $\omega = 10\pi$) is periodic or not. If it is periodic, please also write down the fundamental period.

   Hint 2: If you do not know the answer to the previous question, you can assume

$$y(t) = \left(\frac{e^{j\omega t} + e^{-j\omega t}}{5} \right)^2 \tag{9}$$

   to solve this question. You may need to use the equalities

$$e^{j\theta} = \cos(\theta) + j\sin(\theta) \tag{10}$$
$$e^{-j\theta} = \cos(\theta) - j\sin(\theta) \tag{11}$$
$$\sin(\theta)\sin(\phi) = \frac{\cos(\theta - \phi) - \cos(\theta + \phi)}{2} \tag{12}$$

   along the process. You will receive full credits if your final answer is correct.

Question 4: [10%, Work-out question, Learning Objectives 1, 4, 5, and 6]
Consider the following DT signal.

$$x[n] = e^{j\frac{7\pi(n-\sqrt{2})}{8}} + \cos(\frac{\pi n - \sqrt{3}}{4}) + \sin(0.5\pi(n + \ln(2))). \tag{13}$$

Is $x[n]$ periodic? If so, find the fundamental period of $x[n]$. If not, carefully explained why $x[n]$ is not periodic.

This is NOT a yes/no question. Please carefully explain your answer.

Question 5: [12%, Work-out question, Learning Objective 1]

Consider the following system that takes a continuous-time signal $x(t)$ as input and outputs a discrete-time signal $y[n]$:

$$y[n] = n^2 \cdot \sin(0.5n) \cdot x(5\pi n - 1.5) \tag{14}$$

1. [12%] Is the above system is linear or not? Carefully explain the steps how you prove that the system is linear or not.

Question 6: [20%, Multiple Choices, Learning Objectives 1 and 6]

The following questions are multiple-choice questions and there is no need to justify your answers. Consider two continuous-time signals:

$$x_1(t) = \int_{s=t-5}^{t+5} \left(\cos(\frac{2\pi}{10}s) + \cos(\frac{2}{10}s) \right) ds \qquad (15)$$

$$x_2(t) = \frac{e^{j|t|} + e^{-j|t|}}{2} \cdot (\cos(2t))^2 \qquad (16)$$

and two discrete-time signals:

$$x_3[n] = \sum_{k=-4}^{3} (-1)^k \cdot \delta[n - 2 + 4k] \qquad (17)$$

$$x_4[n] = \sum_{k=-\infty}^{\infty} 3^{-|k|} e^{j\pi(n-k)}. \qquad (18)$$

1. [10%] For $x_1(t)$ to $x_4[n]$, determine whether it is periodic or not, *respectively*. If it is periodic, write down the fundamental period. Please state explicitly which signal is periodic and which is not.

2. [10%] For $x_1(t)$ to $x_4[n]$, determine whether it is even or odd or neither of them, respectively. Please state explicitly which signal is even, which is odd, and which is neither.
