Midterm \#1 of ECE 301-003 and OL1, (CRN: 11474 and 26295) 8-9pm, Wednesday, February 10, 2021, Online Exam.

1. Enter your student ID number, and signature in the space provided on this page now!
2. This is a closed book exam.
3. This exam contains multiple-choice questions and work-out questions. For multiple choice questions, there is no need to justify your answers. You have one hour to complete it. The students are suggested not spending too much time on a single question, and first working on those that you know how to solve.
4. Use the back of each page for rough work.
5. Neither calculators nor help sheets are allowed.

As a Boiler Maker pursuing academic excellence, I pledge to be honest and true in all that I do. Accountable together - We are Purdue.

Question 1: [15\%, Work-out question] Consider a CT signal:

$$
\begin{equation*}
x(t)=e^{-3|t|} \tag{1}
\end{equation*}
$$

We construct another signal

$$
\begin{equation*}
y(t)=\frac{1}{2 \pi} \int_{-\infty}^{\infty} x(j \omega) e^{j \omega t} d \omega \tag{2}
\end{equation*}
$$

1. $[11 \%]$ What is the expression of $y(t)$ ?

Hint 1: The absolute value of $3 j$ is $|3 j|=3$.
2. [4\%] What is the even part of $y(t)$ ? What is the odd part of $y(t)$ ? Please write down the expressions of both parts separately.
Hint 2: You may want to write $\frac{1}{b+c \cdot j}=\frac{b-c \cdot j}{b^{2}+c^{2}}$. This would make the expression simpler.

Hint 3: If you do not know the answers of Q1.1 and Q1.2, you can write down the odd part of a DT signal $y[n]=U[n-1]$ and plot it for the range of $-5 \leq n \leq 5$. If your answer is correct, you will receive 6 points.

Note that if you know the answer of Q1.1, you cannot use this alternative question. The alternative question is only for students who do not know how to solve Q1.1.

Question 2: [20\%, Work-out question]
Define two DT signals:

$$
x[n]= \begin{cases}9^{n} & \text { if } n \leq 3  \tag{3}\\ 0 & \text { otherwise }\end{cases}
$$

and

$$
h[n]= \begin{cases}3^{n} & \text { if } n \leq-2  \tag{4}\\ 0 & \text { otherwise }\end{cases}
$$

Compute the expression of the following integral

$$
\begin{equation*}
y[n]=\sum_{k=-\infty}^{\infty} x[k] h[2 n-2 k] \tag{5}
\end{equation*}
$$

Hint: If you do not know the answer to this question, write down the value of the summation $\sum_{k=19}^{221} \sqrt{2}$. You will receive 4 points if your answer is correct.

Question 3: [15\%, Work-out question] Consider two CT signals

$$
\begin{align*}
x(t) & =e^{j \omega \cdot t}  \tag{6}\\
h(t) & = \begin{cases}2 & |t| \leq 1.5 \\
0 & \text { otherwise }\end{cases} \tag{7}
\end{align*}
$$

Find out the expression of $y(t)=\int_{-\infty}^{\infty} x(s) h(t-s) d s$.
Hint 1: It may be easier to apply some change of variables.
Hint 2: You can leave (part of) your answer to be of the form like $\frac{e^{3 j t}-2^{-12 t}}{3+10 j}$. There is no need to further simplify the expression.

Question 4: [15\%, Work-out question]
Consider the following DT signals.

$$
\begin{align*}
& x[n]=(3+4 j)^{-n}  \tag{8}\\
& h[n]=e^{(1+2 j) n} \cdot U[n-50] . \tag{9}
\end{align*}
$$

Define

$$
\begin{equation*}
y[n]=x[n] \cdot h[n] \tag{10}
\end{equation*}
$$

Find the total energy of $y[n]$.
Hint: If $|r|<1$, then we have the following formulas for computing the infinite sum of a geometric sequence.

$$
\begin{aligned}
\sum_{k=1}^{\infty} a r^{k-1} & =\frac{a}{1-r} \\
\sum_{k=1}^{\infty} k a r^{k-1} & =\frac{a}{(1-r)^{2}}
\end{aligned}
$$

If $r \neq 1$, then we have the following formula for computing the finite sum of a geometric sequence.

$$
\sum_{k=1}^{K} a r^{k-1}=\frac{a\left(1-r^{K}\right)}{1-r}
$$

Question 5: [15\%, Work-out question]
Consider the following DT system.

$$
y[n]= \begin{cases}x[n / 5] & \text { if } n \text { is a multiple of } 5, \text { e.g., } n=-5,0,5,10, \cdots  \tag{11}\\ 0 & \text { otherwise }\end{cases}
$$

Is such a system linear? You need to carefully write down your reasonings. An answer without justification will not receive any point.

Question 6: [20\%, Multiple Choices]
The following questions are multiple-choice questions and there is no need to justify your answers. Consider two continuous-time signals:

$$
\begin{align*}
& x_{1}(t)=e^{j \cos 3 t} \sin (7 t-\pi)  \tag{12}\\
& x_{2}(t)=\sum_{k=2}^{10} \cos (3 \sqrt{2 k} \cdot t) \tag{13}
\end{align*}
$$

and two discrete-time signals:

$$
\begin{align*}
& x_{3}[n]=\sum_{k=0}^{|n|} \cos \left(\pi k^{2}\right)  \tag{14}\\
& x_{4}[n]=(U[n+4]-U[n-6]+\delta[n+5]) \cdot \sin (0.25 \pi n) . \tag{15}
\end{align*}
$$

1. [10\%] For $x_{1}(t)$ to $x_{4}[n]$, determine whether it is periodic or not, respectively. If it is periodic, write down the fundamental period. Please state explicitly which signal is periodic and which is not.
2. [10\%] For $x_{1}(t)$ to $x_{4}[n]$, determine whether it is even or odd or neither of them, respectively. Please state explicitly which signal is even, which is odd, and which is neither.
