

I found this program online:

<http://ngspice.sourceforge.net/>

It's yet another SPICE program, distributed as source code, so anyone with a little UNIX competence can compile/use it wherever they want (shay, expert.ics, their own Linux machine, etc.). It works pretty much like that on Nanohub, as far as I can tell; I ran my homework in both it and the Nanohub version, and the results match up nicely. Maybe link to it on the 255 website?
