# EE538 (NTU: CC-560-M) Final Exam Fall 1998 Digital Signal Processing I 

## Cover Sheet

\author{

Test Duration: 120 minutes. <br> Open Book but Closed Notes. <br> Calculators allowed. <br> This test contains six problems. <br> All work should be done in the blue books provided. <br> You must show all work for each problem to receive full credit. <br> Do not return this test sheet, just return the blue books. <br> | Prob. No. | Topic(s) of Problem | Points |
| :--- | :--- | :--- |
| 1. | Difference Equations, LTI Systems | 30 |
| 2. | Sampling, Z-Transform, ZT-DTFT Relationship | 30 |
| 3. | DFT and Time-Domain Aliasing | 30 |
| 4. | Digital Upsampling and Downsampling | 30 |
| 5. | Autoregressive Spectral Analysis | 40 |
| 6. | Windows \& Symmetric FIR Filters | 40 |

}

## Digital Signal Processing I Final Exam 14 Dec. 1998

Problem 1. [30 points]
Consider the causal LTI system implemented as

Figure P1.1
(a) Determine the difference the difference equation relating the output, $y[n]$, to the input, $x[n]$.

The DT system in Figure P1.1 may be alternatively implemented via a lattice structure as

Figure P1.2
(b) For the system in Figure P1.2, determine the difference equation relating the output, $y[n]$, to the input, $x[n]$.
(c) Determine the numerical values of $K_{1}$ and $K_{2}$ so that the relationship between $x[n]$ and $y[n]$ in Figure P1.2 is exactly the same as the relationship between $x[n]$ and $y[n]$ in Figure P1.1, so that the respective difference equations are identical.

## Digital Signal Processing I Final Exam 14 Dec. 1998

Problem 2. [30 points]
Consider the analog signal

$$
x_{a}(t)=e^{-(4 \ln 2) t} \cos (2 \pi t) u(t)
$$

where $\ln x$ denotes the natural logarithm of $x$ such that $e^{\ln x}=x$ (Hint: the numbers are selected to work out "nicely".) $x_{a}(t)$, which may be viewed as a transient in an analog circuit, is sampled at a rate $F_{s}=8 \mathrm{~Hz}$ to produce the discrete-time signal $x[n]$, i.e.,

$$
x[n]=x_{a}\left(n T_{s}\right) \quad T_{s}=\frac{1}{8} \text { second }
$$

(a) Determine the Z-transform, $X(z)$, of $x[n]$ and state the region of convergence. (You may use the tables in the book.)
(b) Determine the DTFT of $x[n], X(\omega)$, and provide a rough sketch of $|X(\omega)|$ over $|\omega|<\pi$.

Problem 3. [30 points]
Let $x[n]$ and $h[n]$ be two finite duration sequences of length $L=6$, i.e., $x[n]=h[n]=0$ for $n<0$ and $n \geq 6$. Let $X_{6}(k)$ and $H_{6}(k)$ denote 6-point DFT's of $x[n]$ and $\mathrm{h}[\mathrm{n}]$, respectively. The 6-point inverse DFT of the product $Y_{6}(k)=X_{6}(k) H_{6}(k)$, denoted $y_{6}[n]$, produces the following values:

| n | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $y_{6}[n]$ | 21 | 21 | 21 | 21 | 21 | 21 |

Let $X_{9}(k)$ and $H_{9}(k)$ denote the 9 -point DFT's of the aforementioned sequences $x[n]$ and $h[n]$. The 9 -point inverse DFT of the product $Y_{9}(k)=X_{9}(k) H_{9}(k)$, denoted $y_{9}[n]$, produces the following values:

| n | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $y_{9}[n]$ | 9 | 12 | 15 | 18 | 20 | 21 | 15 | 10 | 6 |

Given $y_{6}[n]$ and $y_{9}[n]$, find the linear convolution of $x[n]$ and $h[n]$, i. e., determine the numerical values of $y[n]=x[n] * h[n]$.

## Digital Signal Processing I Final Exam 14 Dec. 1998

Problem 4. [30 points]
In the figure below, $H_{0}(z)=1+z^{-1}$ and $H_{1}(z)=1-z^{-1}$. Determine the Z-Transform of the synthesis filters, $F_{0}(z)$ and $F_{1}(z)$ so that $y[n]=x[n-1]$, i.e., that the output of the overall system is equal to the input delayed by one time unit for any and all possible input sequences. Show all work in arriving at your answers.

In the figure above,

$$
z_{i}[n]=x_{i}[2 n], \quad i=1,2
$$

and

$$
y_{i}[n]=\left\{\begin{array}{ll}
z_{i}\left(\frac{n}{2}\right), & n \text { even } \\
0, & n \text { odd }
\end{array}, \quad i=1,2\right.
$$

Problem 5. [40 points]
The autocorrelation values for an autoregressive process of order $p=2(\operatorname{AR}(2)$ process $)$ for lag values $m=0, m=1$, and $m=2$ are

$$
r_{x x}[0]=1 \quad r_{x x}[1]=\frac{1}{2} \quad r_{x x}[2]=\frac{1}{8}
$$

(a) Determine the AR model parameters $a_{1}$ and $a_{2}$ and the power, $\sigma_{w}^{2}$, of the input white noise process that generated the AR process.
(b) Determine the numerical values of $r_{x x}[3]$ and $r_{x x}[4]$.
(c) Determine the DTFT of $r_{x x}[m]$ defined as

$$
S_{x x}(\omega)=\sum_{m=-\infty}^{\infty} r_{x x}(m) e^{-j \omega m}
$$

Note: There is no need to compute a DTFT here; just determine $S_{x x}(\omega)$ but note infinite limits, not finite limits in the sum.

Problem 6. [40 points]
Consider the (causal) window of length M described as

$$
w[n]= \begin{cases}\frac{1}{2}-\frac{1}{2} \cos \left(\frac{4 \pi}{M}(n+0.5)\right), & 0 \leq n \leq \frac{M}{4}-1 \\ 1, & \frac{M}{4} \leq n \leq \frac{3 M}{4}-1 \\ \frac{1}{2}-\frac{1}{2} \cos \left(\frac{4 \pi}{M}(n+0.5)\right), & \frac{3 M}{4} \leq n \leq M-1\end{cases}
$$

where $M$ is divisible by 4 , i.e., that $\frac{M}{4}$ is an integer. $w[n]$ may also be expressed as

$$
\begin{gathered}
w[n]=\left\{\frac{1}{2}-\frac{1}{2} \cos \left(\frac{4 \pi}{M}(n+0.5)\right)\right\}\{u[n]-u(n-M)\} \\
+\left\{\frac{1}{2}+\frac{1}{2} \cos \left(\frac{4 \pi}{M}(n+0.5)\right)\right\}\left\{u\left(n-\frac{M}{4}\right)-u\left(n-\frac{3 M}{4}\right)\right\}
\end{gathered}
$$

(a) Plot a rough sketch of the window as a function of $n$. Is the window symmetric or anti-symmetric, i.e., $w[n]=w(M-1-n)$ or $w[n]=-w(M-1-n), n=0,1, \ldots, M-1$ ?
In contrast to the window problem on Exam 3, your brief answers to the questions below may be explained heuristicly via tapering arguments without the need for mathematical analysis, i.e., supporting mathematical analysis is NOT necessary.
(b) Is the width of the mainlobe of the DTFT of $w[n]$ wider or narrower than the width of the mainlobe of the DTFT of a rectangular window of the same length. Explain.
(c) Is the width of the mainlobe of the DTFT of $w[n]$ wider or narrower than the width of the mainlobe of of the DTFT of a Hamming window of the same length. Explain.
(d) Is the peak sidelobe level of the DTFT of $w[n]$ larger or smaller than the peak sidelobe level of the DTFT of a rectangular window of the same length. Explain.
(e) Is the peak sidelobe level of the DTFT of $w[n]$ larger or smaller than the peak sidelobe level of the DTFT of a Hamming window of the same length. Explain.
(f) The DTFT of $w[n]$ may be expressed as

$$
W(\omega)=e^{-j \frac{M-1}{2} \omega}\left\{\sum_{i=1}^{6} A_{i} \frac{\sin \left(\frac{L_{i}}{2}\left(\omega-\omega_{i}\right)\right)}{\sin \left(\frac{1}{2}\left(\omega-\omega_{i}\right)\right)}\right\}
$$

Determine the values of $A_{i}, L_{i}$, and $\omega_{i}, i=1, \ldots, 6$. The answers for $A_{i}, i=1, \ldots, 6$, are real-valued numbers while the answers for $L_{i}$ and $\omega_{i}, i=1, \ldots, 6$, are in terms of $M$. List your answers in the form of a table as shown below. Note: Answers need to be substantiated by work - no points for pure guesses or recalling from memory.

| $i$ | $A_{i}$ | $L_{i}$ | $\omega_{i}$ |
| :--- | :--- | :--- | :--- |
| 1 |  |  |  |
| 2 |  |  |  |
| 3 |  |  |  |
| 4 |  |  |  |
| 5 |  |  |  |
| 6 |  |  |  |
